

How to Build a Sustainability-Focused Equity Allocation

We believe it is possible to build an equity portfolio that meets high sustainability standards without materially changing its return profile.

MAY 24, 2021

NIKUNJ JAIN

Historically, portfolio construction has centered around optimizing return relative to risk, but we increasingly see institutional investors also adding environmental and social impact goals to their portfolio's aims. For example, many institutional investors have committed to shift their portfolio's carbon emissions profile or direct capital toward solutions that address climate change. This focus on sustainability in addition to risk and return affects all asset classes and is particularly important to consider in equities because collecting the equity risk premium is the bedrock of most strategic asset allocations. **This raises the question: how can investors build an equity allocation that can achieve both return/risk and sustainability objectives?**

To answer this question, we have developed a process with the goal of building a diversified equity portfolio that meets high sustainability standards without materially changing its financial characteristics. Making the shift to incorporate sustainability into an equity portfolio requires applying the same rigor to issues of sustainability that we are accustomed to applying to risk and return. It also requires creating a new portfolio construction approach that not only balances return and risk but also adds in impact considerations as a new important dimension.

The charts below illustrate the outcome of our process: a globally diversified equity index—with comparable returns to a traditional global equity portfolio—that includes only companies aligned to the United Nations Sustainable Development Goals (UN SDGs).¹ In the remainder of this report, we describe how we built this allocation, breaking down the problem into two pieces:

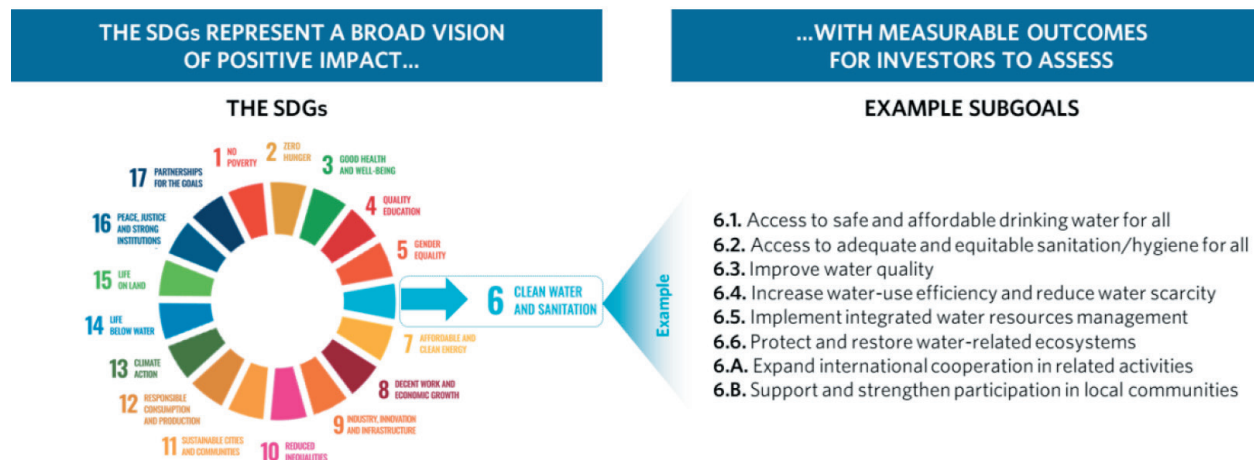

1. **Selecting which companies are aligned with a sustainable future:** We have developed the capability to systematically assess the alignment of thousands of public market equities to the United Nations Sustainable Development Goals.
2. **Engineering the selected companies into a portfolio:** Once we have selected SDG-aligned equities, we leverage our portfolio construction capabilities to build up a diversified index by weighing each company's marginal diversification and sustainability characteristics.

¹ The equity portfolio referred to as SDG-Aligned Equities and described in this piece is shown for illustrative purposes only. Such portfolio is not a strategy or product that Bridgewater manages.

Selecting Which Companies Are Aligned with a Sustainable Future

The first step is choosing a sustainability or impact goal for your portfolio. Before investors can build a sustainable portfolio, they must decide what “sustainability” means to them. We use the United Nations Sustainable Development Goals, which are a broad global framework for social and environmental impact agreed to by most governments globally. The goals are expansive, ranging from ending poverty to providing affordable and clean energy, and we believe they address many investors’ most important sustainability goals. For example, environmental sustainability and climate change affire a top priority for many asset owners, and these play a large role in the SDGs (6 of the 17 goals address climate and the environment directly). The SDGs also contain around 200 specific and measurable indicators defined by the UN that help investors and researchers to assess real-world corporate activities.

² Returns through May 19, 2021 and are shown gross of fees. SDG-Aligned Equities is shown for illustrative purposes only and does not represent a strategy managed by Bridgewater. SDG-Aligned Equities is constructed using Bridgewater analysis, which selects equity securities that are aligned with the UN SDGs and then combines such equity securities into an index based on publicly available market data. The results do not represent actual results and actual results may significantly differ from the simulated returns being presented. Readers should consider the limitations inherent in simulated results. It is expected that the simulated performance will periodically change as a function of both refinements to our methodology and the underlying market data. Past performance is not indicative of future results. Please review the “Important Disclosures and Other Information” located at the end of this report.

The next step is building a scalable process to assess public companies against that goal. After choosing a goal, we develop a perspective on what we aim to measure and why (what we call a “data concept”)—rather than reacting to the mountain of messy data that is increasingly available to investors on ESG issues. Given that institutional investors tend to have exposure to hundreds if not thousands of public market equities, a systematic process to assess equities is required to make the process scalable. Of course, systemization also forces a rigor in thinking (because it can be evaluated) and provides the opportunity to build in diversification and triangulation across multiple perspectives.

In our analysis, companies are rated on two dimensions, capturing the two ways corporates can have impact:

1. **What They Do:** Companies impact the world through the goods and services they provide. We break down a company’s revenues into its various goods and services and align each of them with achieving sustainability goals. Even a very high-level goal like “Reduced Inequalities” can be mapped to specific business goods and services that are aligned with that goal (e.g., expanding financial services provided to underserved and low-income communities).
2. **How They Do It:** In addition to their revenue lines, companies also impact the world through behavioral practices such as their environmental footprint and labor practices. Each of these can be mapped to relevant sustainability metrics (e.g., carbon emissions or child labor). The relevance of each of these elements depends on the nature of the business (e.g., carbon emissions are more significant to a manufacturer than to a services business), so we look at close to 100 measures of business practices but weigh the relevance of these issues for each company.

The chart below shows the outcome of that process. Utilizing our systematic approach, we analyzed over 6,000 of the largest publicly traded companies, covering over \$60 trillion in available market cap. Our starting universe, illustratively highlighted in the top right box, consists only of those companies that meet our principles for sustainability in “what they do” and “how they do it.”

Engineering the Selected Companies into a Portfolio

Because there are so many stocks to choose from in the world with similar fundamental exposures to macroeconomic conditions, **we believe that what is lost by reducing the universe of stocks held in terms of the marginal benefit of diversification is relatively modest.** The chart below shows this from a theoretical perspective. The initial gains from diversification—moving from 1 to 50 securities—are substantial, while the later gains—moving from 50 securities to 500 securities—are very small. As an illustration, when we engineered a portfolio using the goals and selection process described above, we selected about 300 companies constituting about \$13 trillion of market cap to build a diversified allocation.

Building a well-diversified portfolio out of the selected companies requires expanding traditional portfolio construction capabilities, which carefully examine how to achieve optimal diversification from any set of assets, to add in a third dimension that also considers sustainability characteristics in that process. From a risk-reducing diversification perspective, the goal is to avoid a range of biases such as sectoral concentration (e.g., healthcare), geographical concentration (e.g., Europe), company concentration, and factor concentration (e.g., valuation). From a sustainability perspective, the most-aligned companies should have more weight than those with less alignment to social and environmental goals. Going through this process, we believe it is possible to engineer a portfolio of equities with substantially similar financial characteristics as a global equity index—comprised only of companies that were selected to meet high sustainability standards.

Stock returns are driven by corporate cash flows and how those cash flows are discounted; growth and inflation are the dominant drivers of corporate cash flows, and risk premiums and discount rates determine how these cash flows are discounted to today. These exposures are widely shared across stocks. A diversified mix of sustainable equities shares the same overall macro exposures as a typical global index, and the returns of a portfolio of sustainable equities can, in large part, be explained by shifts in these macro factors.

3

Replication Based on Growth, Inflation, Risk Premiums & Discount Rates (Annual Gross Excess Return, Simulated)

4

³ Rising/Falling Growth/Inflation refer to perspectives from Bridgewater's analysis called the "AW Lens," which is an analytical approach to assess the behavior of the major drivers of asset performance and their impact on markets during any given period based on Bridgewater's understanding of global financial markets. Returns through May 19, 2021 and are shown gross of fees. SDG-Aligned Equities is shown for illustrative purposes only and does not represent a strategy managed by Bridgewater. SDG-Aligned Equities is constructed using Bridgewater analysis, which selects equity securities that are aligned with the UN SDGs and then combines such equity securities into an index based on publicly available market data. The results do not represent actual results and actual results may significantly differ from the simulated returns being presented. Readers should consider the limitations inherent in simulated results, including limitations and assumptions with SDG construction process. It is expected that the simulated performance will periodically change as a function of both refinements to our methodology and the underlying market data. Past performance is not indicative of future results. Please review the "Important Disclosures and Other Information" located at the end of this report.

⁴ Returns through May 19, 2021 and are shown gross of fees. SDG-Aligned Equities is shown for illustrative purposes only and does not represent a strategy managed by Bridgewater. SDG-Aligned Equities is constructed using Bridgewater analysis, which selects equity securities that are aligned with the UN SDGs and then combines such equity securities into an index based on publicly available market data. The results do not represent actual results and actual results may significantly differ from the simulated returns being presented. Readers should consider the limitations inherent in simulated results. It is expected that the simulated performance will periodically change as a function of both refinements to our methodology and the underlying market data. Past performance is not indicative of future results. SDG-Aligned Equities Replication is constructed based on the expected returns of SDG-Aligned Equities based on their environmental biases using a process referred to as the AW Lens, which is an analytical approach to assess the behavior of the major drivers of asset performance and their impact on markets during any given period based on Bridgewater's understanding of global financial markets. Information shown is the result of analyses of actual and simulated market data. Please review the "Important Disclosures and Other Information" located at the end of this report.

And a diversified mix of sustainable equities also looks quite like market indices in terms of its valuation characteristics. Sustainable equities have a slightly lower P/E ratio in aggregate; our bubble gauge, which provides our perspective on stock market valuations, shows the sustainable mix as modestly overvalued, while valuations in the market overall are a bit more stretched (and there are some of the concentrated pockets of froth with much higher valuations).

⁵ The retail bubble slice refers to a slice of equities where BW analysis indicates that valuations are most stretched due to retail activity. SDG-Aligned Equities represents an illustrative view of equity allocations that uses SDG ratings to select SDG-aligned assets. This index is constructed based on Bridgewater analysis and does not represent returns of any actual Bridgewater strategy.

Tracking and Measuring a Portfolio Against Social and Environmental Sustainability Goals

Investors are accustomed to tracking, measuring, and reporting on the financial characteristics of their portfolio. A portfolio with added sustainability goals should also have a process of tracking, measuring, and reporting on these goals as well. Below, we give a few quick illustrations of how investors can do this.

First, investors can examine how different companies' goods and services contribute to individual Sustainable Development Goals through their offerings of goods and services. A typical equity allocation ends up with a modest allocation to companies aligned to most Sustainable Development Goals; in the case of climate, for example, it is a net negative when you add up companies that detract from the goal of decarbonizing the economy. The picture is quite similar for most held global ESG indices; in part, this is because many large indices prioritize minimizing tracking error to the benchmark, so they focus on "trimming the tail" by removing only a few companies with the worst business practices. In contrast, we start by establishing a very high sustainability bar (standards for alignment on both products and services, and business behavior) and then overlay our portfolio construction expertise, a process we call "3D Portfolio Construction." This results in a portfolio with meaningfully higher alignment to many SDGs (including SDG 3, which is focused on healthcare, and SDGs 7 and 13, which are focused on climate). It is also worth noting that several of the SDGs (e.g., SDG 16: Peace, Justice, and Strong Institutions) are less directly relevant to company products and services.

⁶ SDG-Aligned Equities is shown for illustrative purposes only and does not represent a strategy managed by Bridgewater. SDG-Aligned Equities is constructed using Bridgewater analysis, which selects equity securities that are aligned with the UN SDGs and then combines such equity securities into an index based on publicly available market data.

Additionally, investors can measure and track how their portfolio is performing in terms of business behaviors. As shown below, an equity index assessed through our process has better aggregate business behavior than global equities on relevant topics such as environmental activity (e.g., pollution and waste), social and labor considerations (e.g., supply chain quality and non-discrimination of labor), and corporate governance.

7

Increasingly, investors are also able to measure impact directly, for example by accounting for companies' environmental damage. Below, in partnership with the Harvard Business School Impact-Weighted Accounts Initiative, we assign a dollar value to the environmental impact that companies have as a by-product of their business (e.g., for every unit of greenhouse gas emissions and waste generated, a dollar cost is assigned). Comparing this to the revenues that the company has allows us to answer the question, "How profitable would a company actually be if we accounted for the environmental impact of the business?" A sustainable equity mix reflects a much lower environmental footprint for corporate activities.

8

⁷ SDG-Aligned Equities is shown for illustrative purposes only and does not represent a strategy managed by Bridgewater. SDG-Aligned Equities is constructed using Bridgewater analysis, which selects equity securities that are aligned with the UN SDGs and then combines such equity securities into an index based on publicly available market data.

There is no consideration given to the specific investment needs, objectives or tolerances of any of the recipients. Additionally, Bridgewater's actual investment positions may, and often will, vary from its conclusions discussed herein based on any number of factors, such as client investment restrictions, portfolio rebalancing and transactions costs, among others. Recipients should consult their own advisors, including tax advisors, before making any investment decision. This material is for informational and educational purposes only and is not an offer to sell or the solicitation of an offer to buy the securities or other instruments mentioned. Any such offering will be made pursuant to a definitive offering memorandum. This material does not constitute a personal recommendation or take into account the particular investment objectives, financial situations, or needs of individual investors which are necessary considerations before making any investment decision. Investors should consider whether any advice or recommendation in this research is suitable for their particular circumstances and, where appropriate, seek professional advice, including legal, tax, accounting, investment or other advice.

The information provided herein is not intended to provide a sufficient basis on which to make an investment decision and investment decisions should not be based on simulated, hypothetical or illustrative information that have inherent limitations. Unlike an actual performance record simulated or hypothetical results do not represent actual trading or the actual costs of management and may have under or over compensated for the impact of certain market risk factors. Bridgewater makes no representation that any account will or is likely to achieve returns similar to those shown. The price and value of the investments referred to in this research and the income therefrom may fluctuate. Every investment involves risk and in volatile or uncertain market conditions, significant variations in the value or return on that investment may occur. Investments in hedge funds are complex, speculative and carry a high degree of risk, including the risk of a complete loss of an investor's entire investment. Past performance is not a guide to future performance, future returns are not guaranteed, and a complete loss of original capital may occur. Certain transactions, including those involving leverage, futures, options, and other derivatives, give rise to substantial risk and are not suitable for all investors. Fluctuations in exchange rates could have material adverse effects on the value or price of, or income derived from, certain investments.

Where shown SDG-Aligned Equities is shown for illustrative purposes only and does not represent a strategy managed by Bridgewater. SDG-Aligned Equities is constructed using Bridgewater analysis, which selects equity securities that are aligned with the UN SDGs and then combines such equity securities into an index based on publicly available market data.
